Biology is the scientific study of life. It is a natural science with a broad scope but has several unifying themes that tie it together as a single, coherent field. For instance, all organisms are made up of cells that process hereditary information encoded in genes, which can be transmitted to future generations.Another major theme is evolution, which explains the unity and diversity of life.

Nicotinamide adenine dinucleotide (NAD +) is a classical coenzyme mediating many redox reactions.NAD + also plays an important role in the regulation of NAD +-consuming enzymes, including sirtuins, poly-ADP-ribose polymerases (PARPs), and CD38/157 ectoenzymes.NAD + biosynthesis, particularly mediated by nicotinamide phosphoribosyltransferase (NAMPT), and SIRT1 function together to regulate ...

1. Overview 1.1 Historical Considerations. Developmental biology is the science that investigates how a variety of interacting processes generate an organism's heterogeneous shapes, size, and structural features that arise on the trajectory from embryo to adult, or more generally throughout a life cycle (Love 2008; Minelli 2011a).

A. An Overview of the Drosophila Core Hippo Pathway. The Hippo cascade is one of the fundamental, and first discovered, YAP/TAZ regulators. In Drosophila, the key kinase of the Hippo cascade, encoded by the LATS/warts gene, was identified in 1995 in a genetic mosaic screen aimed at isolating genes regulating the growth of larval tissues (97, 236).The function of LATS/warts remained rather ...

Cell division is the reproductive mechanism where all living organisms develop and produce off spring. Actively dividing eukaryote cells pass through a series of stages known collectively as the cell cycle: two gap phases (G1 and G2); an S (for synthesis) phase, in which the genetic material is duplicated; and an M phase, in which mitosis ...
