In medicine, the electrical circuits and electrical components are often utilized to detect the biomedical signal by sensor. After basic electrical components and biomedical sensors are connected together, a bioinstrumentation is then formed. Hence, describing a bioinstrumentation could begin with charge, current, voltage, power and energy.

Complex random vectors are commonly used in applications such as wireless communications, harmonic analysis, biomedical sensors (e.g., fMRI), sensor array signal processing, and radar. Many spectrally efficient modulation schemes as well as some of the recent radio transceiver developments are prime examples of this, all being based on complex-valued signal models.

Bandwidth All sensors have finite response times to an instantaneous change in physical signal. In addition, many sensors have decay times, which would represent the time after a step change in physical signal for the sensor output to decay to its original value. The reciprocal of these times correspond to the upper and lower cutoff frequencies, respectively. The bandwidth of a sensor is the ...
