Data-flow analysis is a technique for gathering information about the possible set of values calculated at various points in a computer program. A program's control-flow graph (CFG) is used to determine those parts of a program to which a particular value assigned to a variable might propagate. The information gathered is often used by compilers when optimizing a program.

Graph neural networks can be obtained as an instance of the "Geometric Deep Learning blueprint" [22], a group-theoretical framework allowing to derive deep learning architectures from the symmetry of the domain underlying the data. In graphs, this symmetry is node permutation, as graphs do not have a canonical node ordering.
